

# Switchable Smart Glass

## REAR PROJECTION

Switchable glass and film can be used as a rear projection screen.

In its frosted "off" state switchable glass and film makes an excellent high-resolution rear projection screen for video presentations, provides remarkable image clarity.

The projector should be 1 to 3 meters away and slightly inclined with room lighting dimmed for optimal resolution.

Note. Switchable glass panels should not be turned on during projection as projector's light beam may injure the eyes of viewers.

Front projection is not recommended for switchable glass panels because the image will be blurred.
